FIELD VISIT APP

Please test the app

A short walk-through so you can try the app yourself and tell us it does what you asked for. It takes about 20 minutes.

Start on a computer, then move to your phone.

You create the visit in the office screen first, which gives you a link. Then you open that link on your phone at the property.

What you need

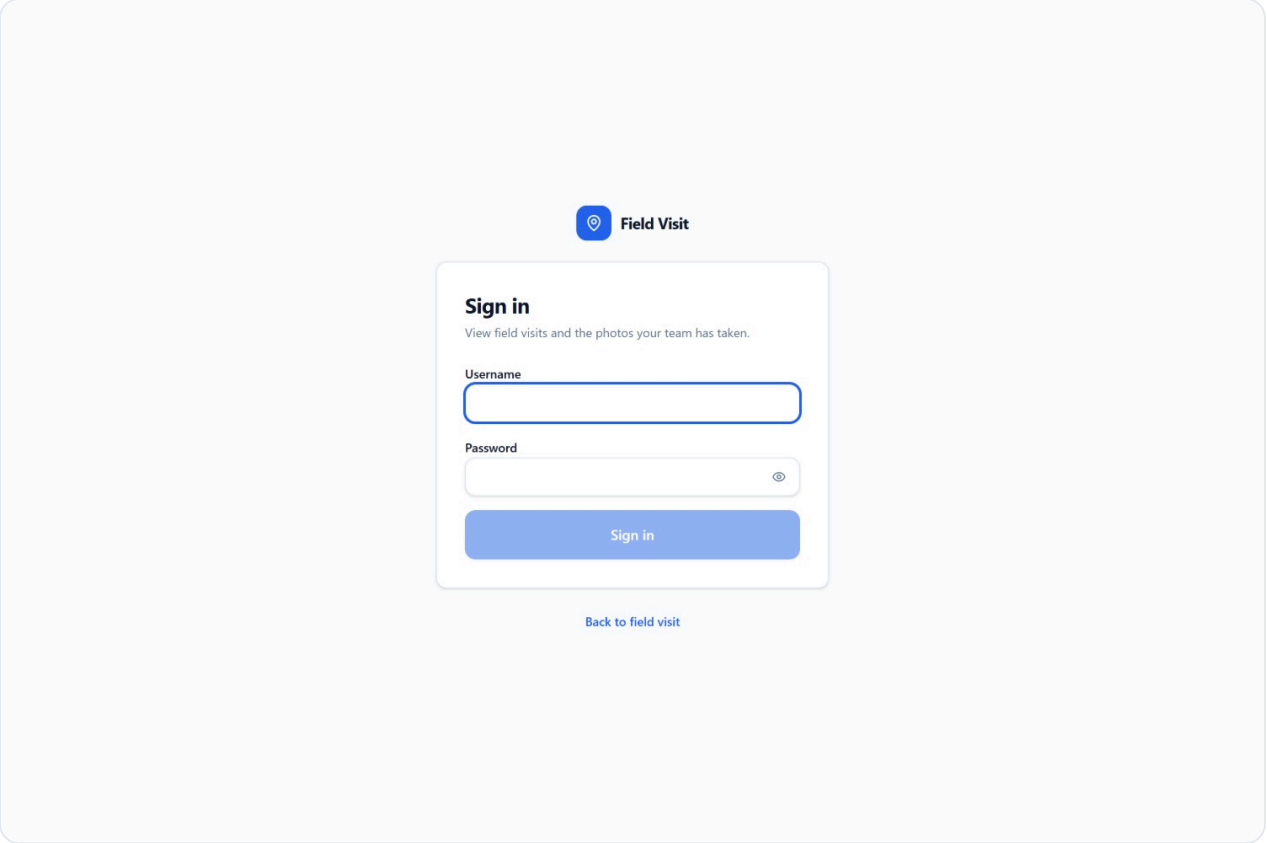

- A computer, to create the visit and later to check the office screens
- A mobile phone with a camera — Android or iPhone, either is fine
- To be able to stand at the property you choose

Part 1 · Create the visit

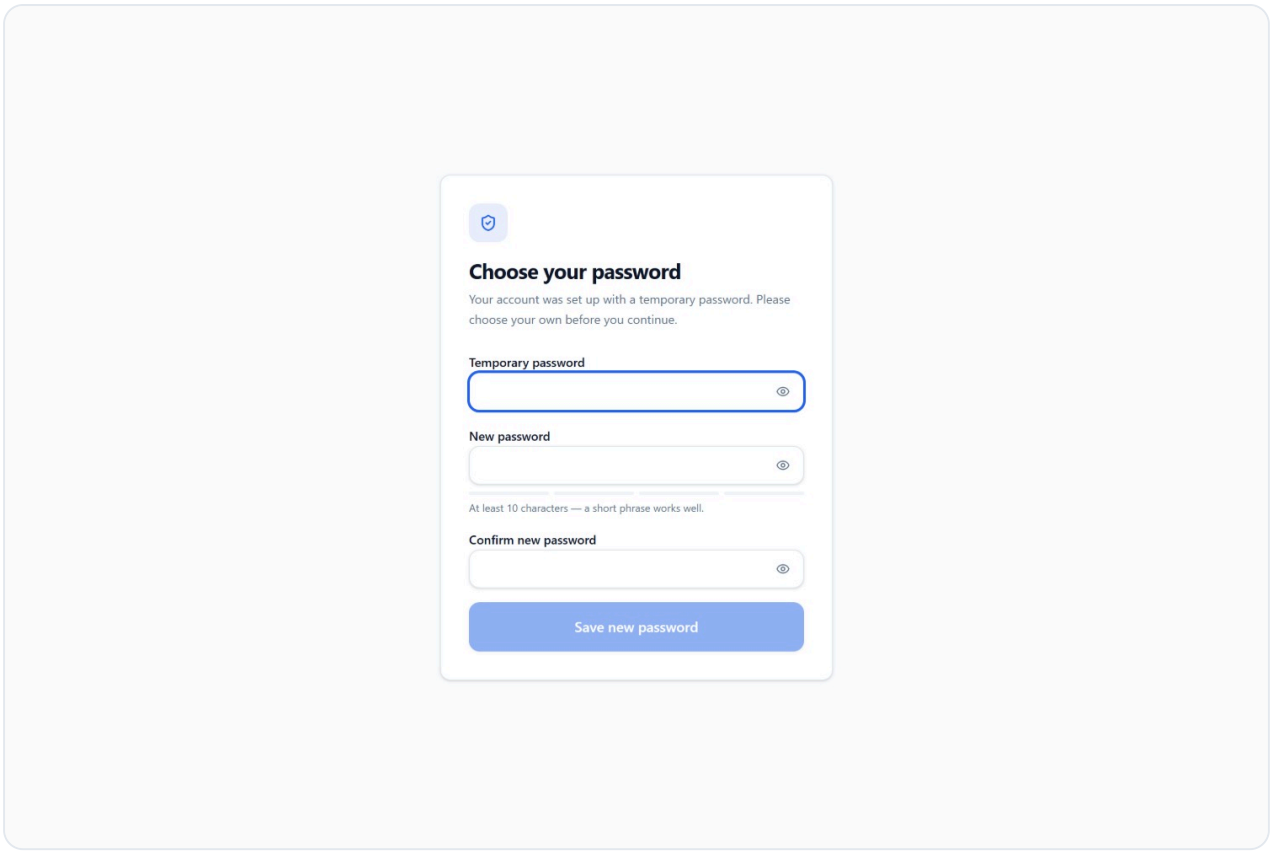

On a computer. We will send you a username and a first-time password.

1 Sign in and choose your password

Open the office link we send you and sign in. The first time, the app asks you to pick your own password. You can change it again later using the button at the top of the screen.

Signing in

Setting your own password

CHECK

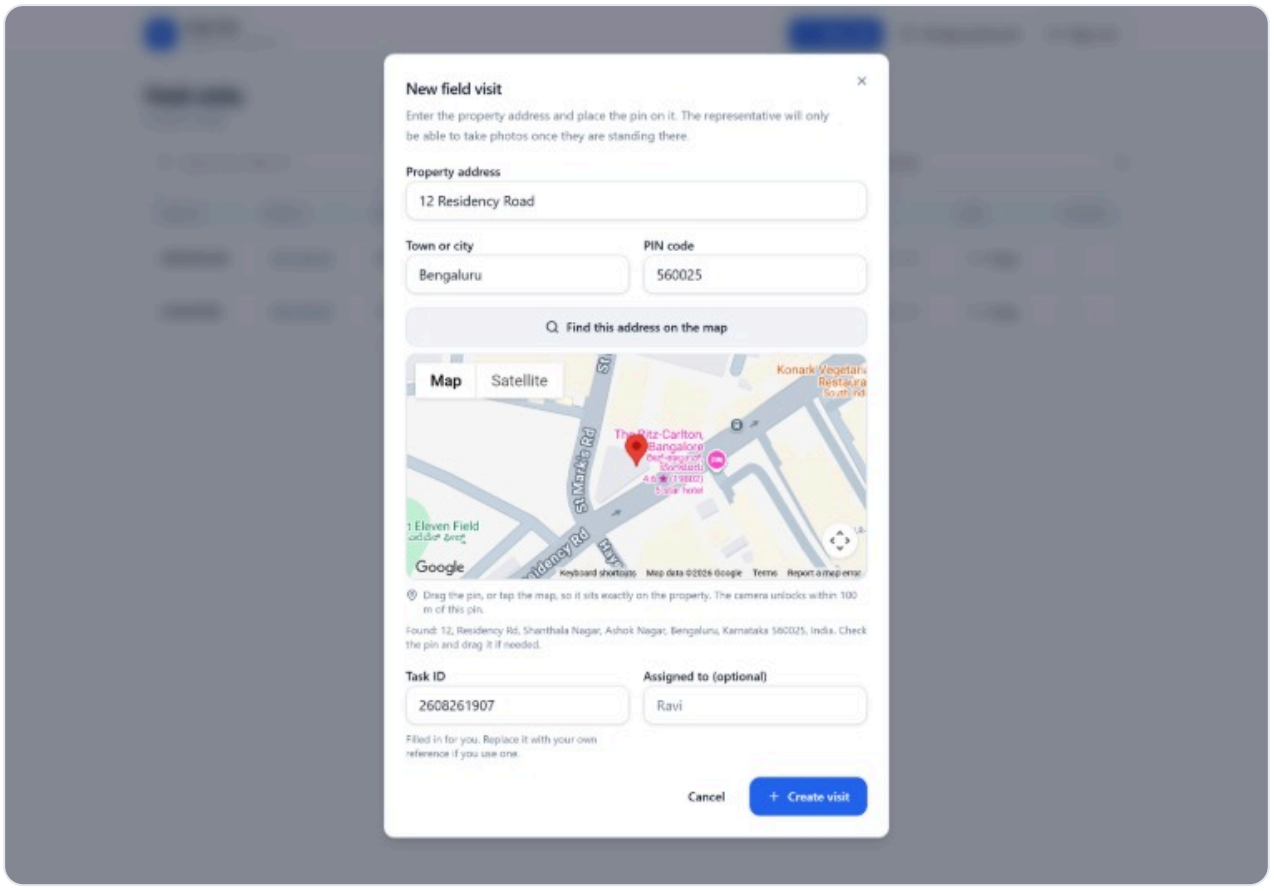

Your new password works, and the old one no longer does.

2 Add the property

Press *New visit*. Type the property address, then press *Find this address on the map*. A pin appears on the property.

If the pin is slightly off, drag it, or tap the map, until it sits exactly on the building. This is the spot your staff will need to reach before the camera will work.

A Task ID is filled in for you. If your own system already gives each job a number, type that in instead.

Adding a property and placing the pin

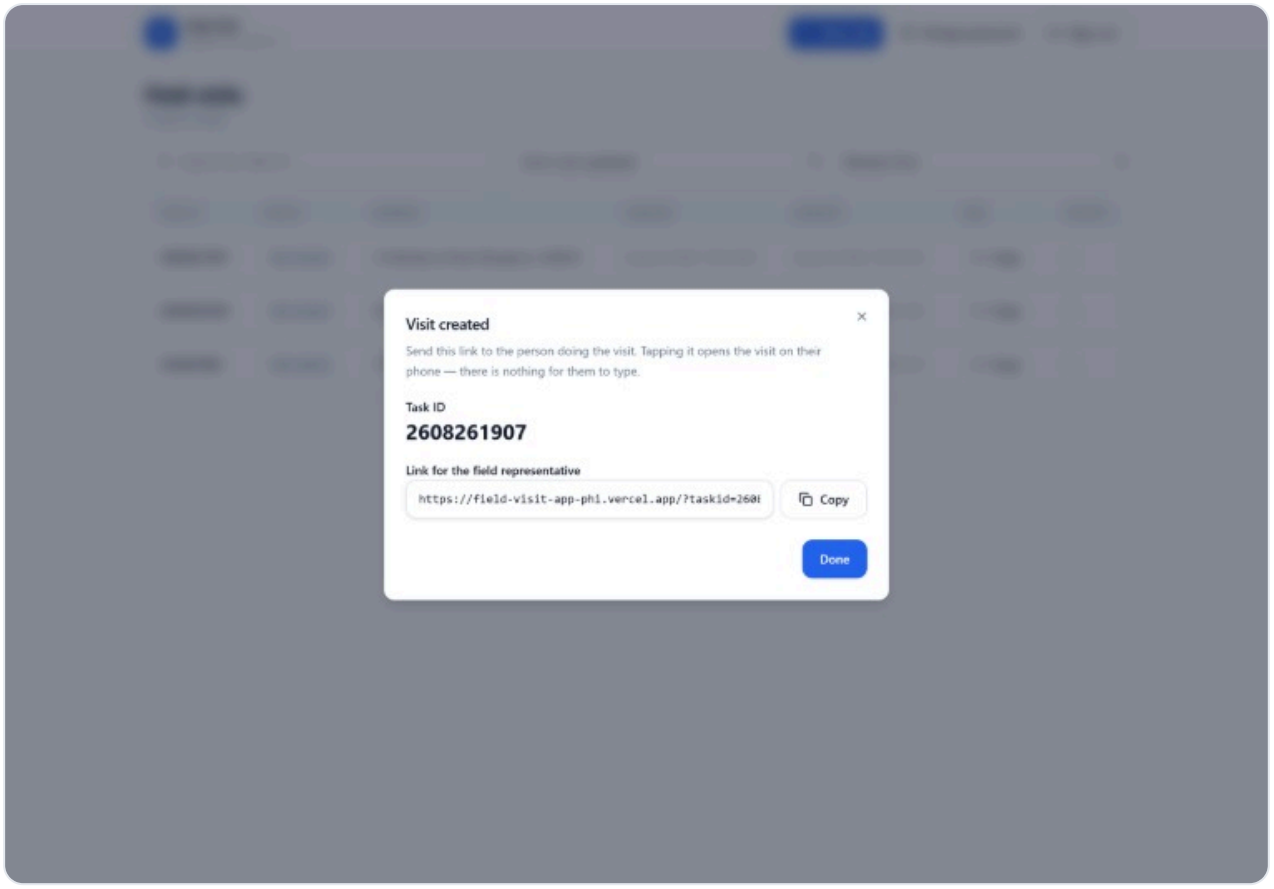

CHECK

The pin lands on the right building, and you can move it by dragging.

3 Copy the link

The app gives you a link for that visit. Send it to whoever is going out to the property — by message, email, or however you normally reach them.

You can copy the link again at any time from the *Link* column in the list of visits.

The link to send to the field representative

CHECK

The link copies, and the new visit shows in the list.

Now switch to your mobile phone

The next part has to be done on a phone, standing at the property you just added. The app uses the phone's camera and its location, so it will not work on a computer.

Open the link you just copied on your phone to begin.

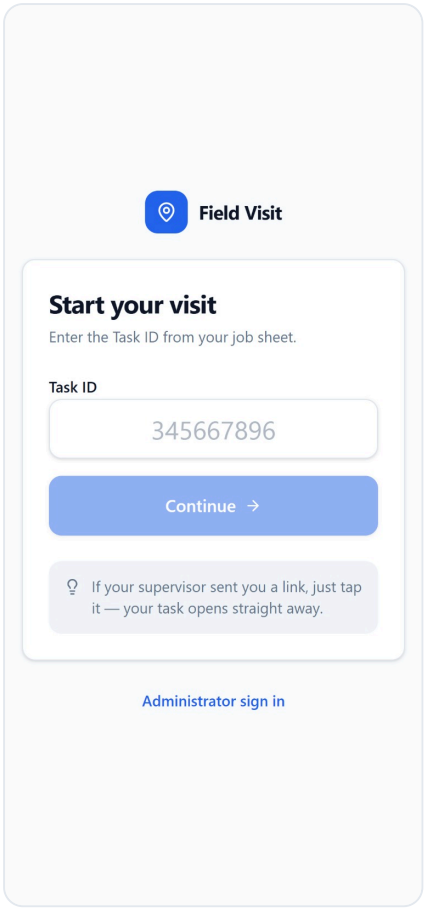

Part 2 · At the property

On your phone, standing at the property.

4 Open the app

Tap the link you copied in step 3. The visit opens straight away — there is nothing to type.

You can also open the app and type in the Task ID instead. Either way opens the same visit.

Typing the Task ID by hand

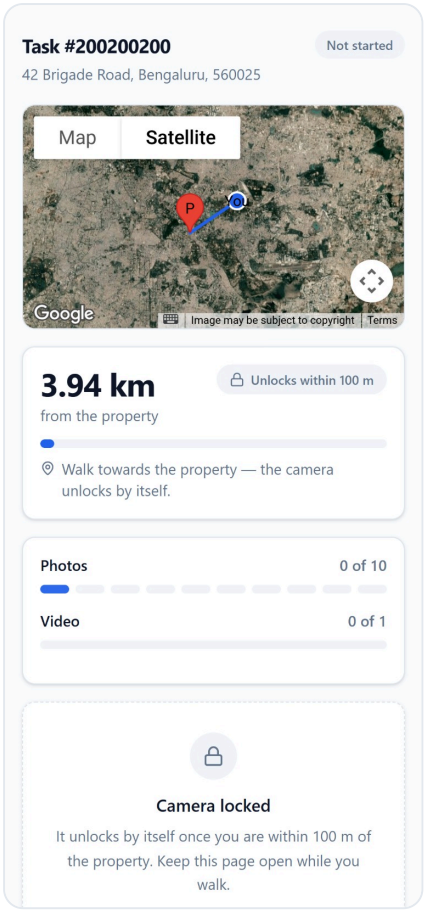

CHECK

Both ways open the same visit.

5 Check the property details and map

The address you added is shown at the top. The map shows the property and where you are standing, and the app tells you how far away you are.

While you are still away from it, the camera stays switched off.

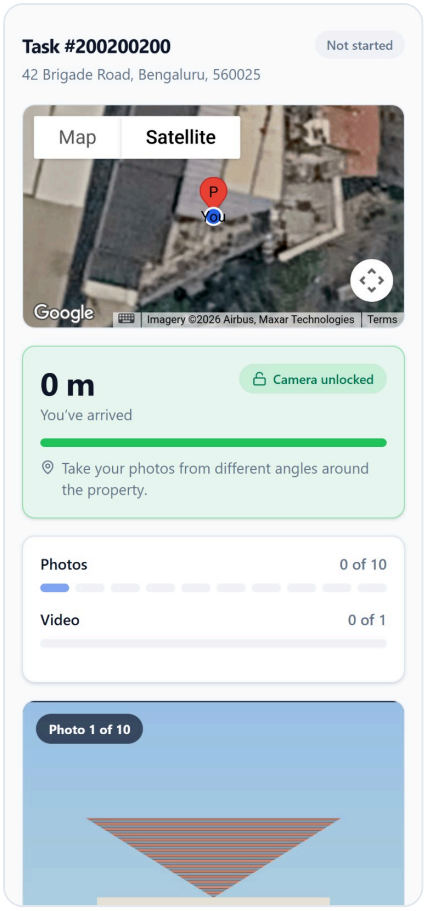

Away from the property, the camera is off

CHECK

The address is right, and the distance goes down as you walk closer.

6 Walk up to the property

Once you are within 100 metres, the panel turns green and the camera switches on by itself. There is nothing to press.

Within 100 metres, the camera switches on

CHECK

The camera only works once you are close to the property.

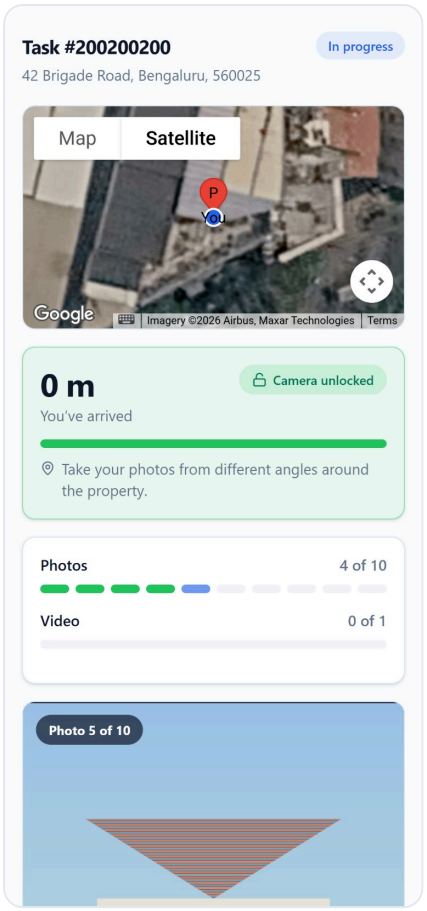

7 Take the 10 photos

The button tells you which photo you are on. Walk around the property so every photo is from a different side.

In the corner you will see which way you are facing and the time. Both are printed onto the photo, so they stay on it for good.

The direction and time are printed on the photo

Progress is shown as you go

CHECK

The letter changes as you turn around, and the count goes up after every photo.

8 Record the video

After the tenth photo the button changes to *Start recording*. Walk slowly around the property while it records, then press stop.

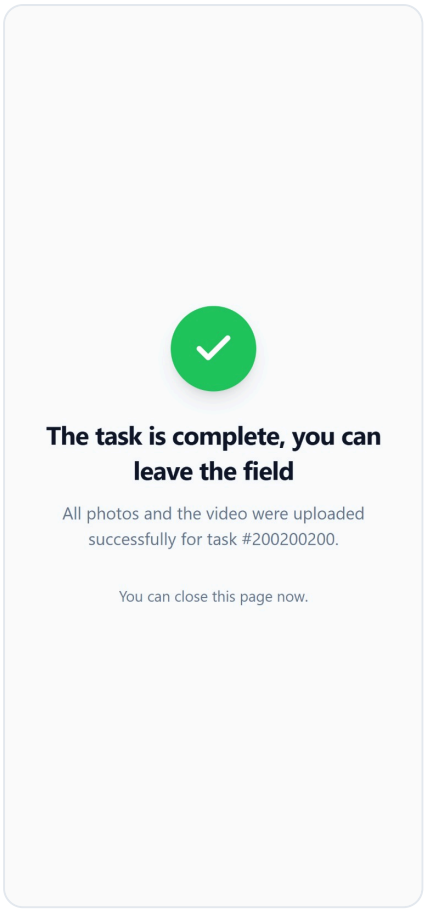

Recording, with the time counting up

CHECK

The direction and time show on the video too, and keep changing as you walk.

9 See the confirmation

Once all 10 photos and the video are saved, the app tells you the visit is done.

The message shown when everything is saved

> **CHECK**
>
> The message reads exactly: *The task is complete, you can leave the field*

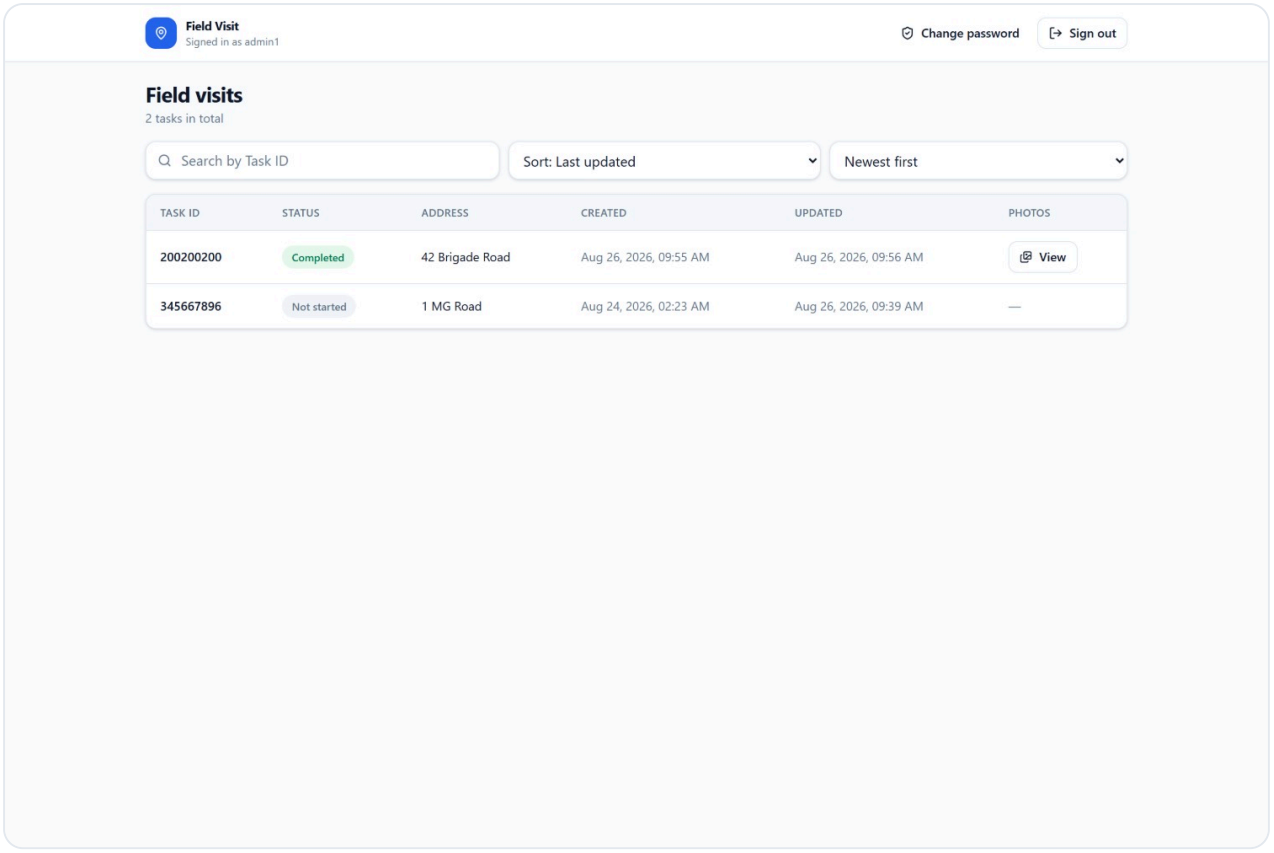

Part 3 · Check what was captured

Back on the computer.

10 Find the visit

Every visit is listed here, including the one you just did. You can put them in order by the date they were created or last updated, and you can search for a Task ID.

The visit you just did shows as *Completed*.

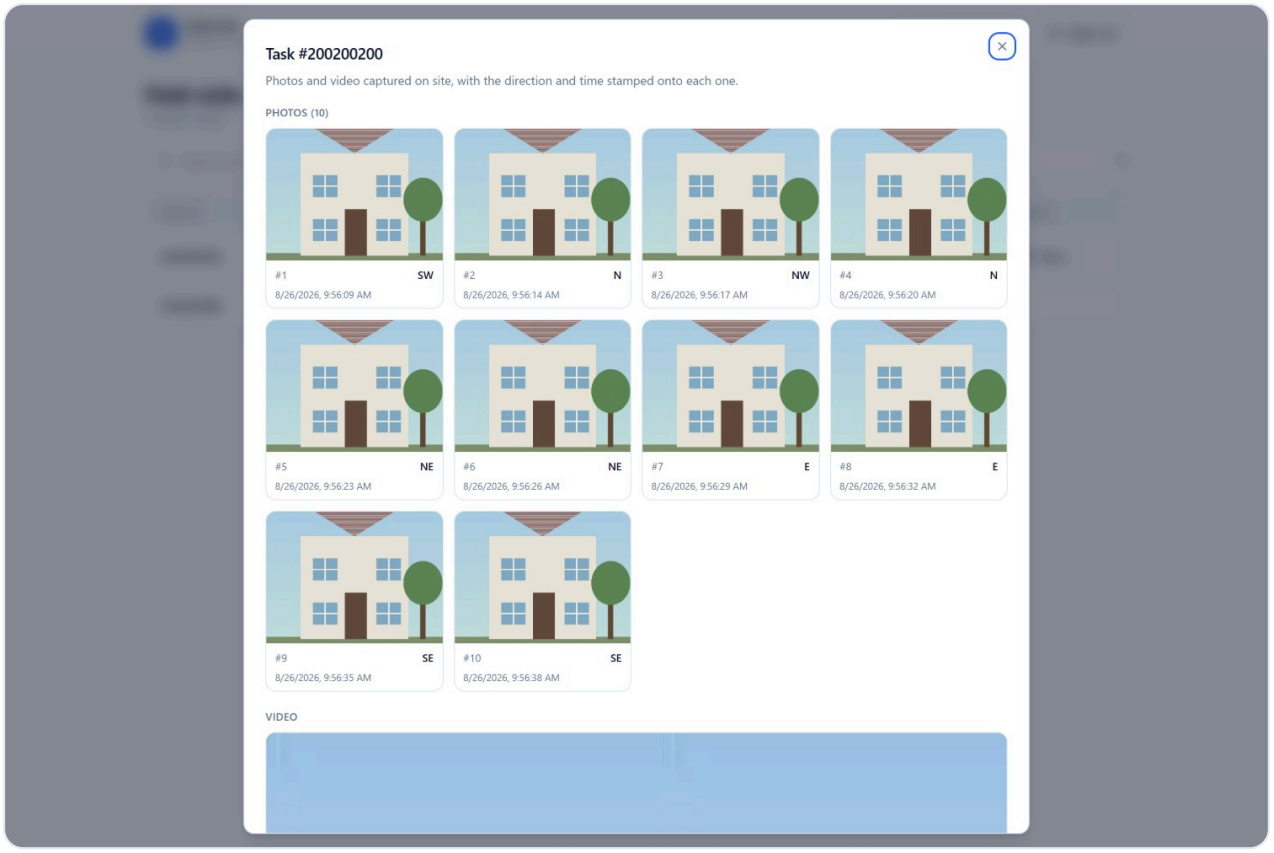

All visits, with search and sorting

> **CHECK**
>
> Both orderings work, and searching the Task ID finds your visit.

11 Look at the photos and video

Press *View* to see everything that was taken. Each photo shows the direction and the time. Click any photo to see it full size.

All ten photos and the video for one visit

> **CHECK**
>
> All 10 photos and the video are there, each with the direction and time on it.

Sign-off

If all of these are true, the app does what you asked for.

	WHAT WAS ASKED FOR
☐	Office staff can add a property and get a link to send out
☐	Staff can open a visit with a Task ID, or by tapping a link

	WHAT WAS ASKED FOR
☐	The address and a map appear, showing how far away the person is
☐	The camera only works once they reach the property
☐	10 photos and 1 video are taken with the phone’s camera
☐	The direction, date and time are printed on every photo and on the video
☐	Each photo is saved as soon as it is taken
☐	The message *The task is complete, you can leave the field* appears once everything is saved
☐	Office staff sign in separately and can set their own password
☐	Office staff can order visits by created date and updated date, and search by Task ID
☐	Office staff can see the photos and video for any visit

If anything does not work the way it is described here, just tell us the step number and what you saw, and we will put it right.
